

BUILD WITH GEMINI XPRIZE

Fiakto

Todo tiene solución.

An AI-native marketplace that turns "something is wrong at my house" into structured, accountable, priced work — matching customers with verified home-service professionals via Gemini.

Pablo Ian Laurino — Buenos Aires, Argentina — github.com/Pablolan92/Fiakto

THE PROBLEM

Nobody describes the same problem the same way twice

- A pipe starts leaking at 11pm. The customer doesn't know if it's a five-minute fix or an emergency, and has no idea what a fair price looks like.
- They ask around, repeat the same explanation to three or four people, and end up comparing quotes that describe different jobs entirely.
- Meanwhile, a qualified professional five blocks away has no way to see that request exists.
- The missing piece isn't more messages — it's a structured, trustworthy handoff from an informal complaint to priced, accountable work.

WHAT FIAKTO DOES

A home-services marketplace, piloting in Buenos Aires

- Customer submits a photo, a short description, and an approximate location.
- Gemini triages it: trade, plain-language summary, clarifying questions, risk level, non-binding price range.
- Only verified professionals whose trade + coverage area match ever see the request.
- Exact address stays hidden until a professional is hired and paid.

HOW GEMINI IS USED

Gemini structures evidence — it never makes the consequential call

- Model: **gemini-flash-latest** via the **@google/genai** SDK, called with a strict JSON-only system instruction.
- Output contract: trade, summary, up to 5 clarifying questions, risk level (normal / urgent / emergency), a non-binding ARS price range, and a confidence score.
- The prompt explicitly tells Gemini to return `null` instead of inventing a price when evidence is insufficient.
- "Emergency" is reserved for concrete cues only — visible fire, a suspected gas leak, exposed live wiring, structural collapse — never diagnosed with false certainty.
- A second Gemini call reviews the client's transfer receipt (amount, destination alias/CBU, date) — informative only, never blocking.

MARKETPLACE MECHANICS

Private quotes, automatic commission, in-app chat, closing & ratings

- Professionals submit private quotes (labor + materials) — no one sees a competitor's price.
- Fiakto's commission is calculated automatically the moment a quote is accepted (cash or transfer, either way the fee is recorded the same way).
- Customer and professional talk through Fiakto's own in-app chat, not WhatsApp — any phone/email typed into a message is detected and redacted before it's saved.
- Closing requires a photo of the finished work; the customer reviews it, approves it, and leaves a 1-5 star rating + comment.
- Aggregate numbers (requests, quotes, accepted jobs, closed jobs, fee revenue) are public on **/impacto**.

HONESTY CHECK

What's real today, and what isn't

LIVE IN PRODUCTION

- The Gemini triage call, matching logic, private-quote flow, automatic commission, in-app chat with redaction, and the photo-approval-and-rating closing flow are all live and have been exercised end to end on the deployed app — including one real bank transfer moving real money through the platform's fee logic.
- **What we don't have yet:** independent, third-party market traction. The requests exercised so far were run by the founding team acting as both customer and professional, to validate the pipeline — not by unrelated paying customers.
- We're intentionally not claiming revenue or user numbers that don't exist. The honest claim: the product works, live, end to end, today.

BUSINESS MODEL & FINANCIALS

Pre-revenue by design, not by accident

Item	Amount (ARS)	Notes
Revenue (commission collected)	0	No independent, third-party paying customers yet
Transaction volume processed	~\$16,200	One real transfer through the payment/commission flow, founders' own test accounts
External funding raised	0	Self-funded
Costs incurred	~0	Entirely within Firebase/Gemini free or low-usage tiers

Forward model: an 8% take rate on completed jobs, modeled over 5 years. Operating profit only turns positive in year 5 — an explicit planning hypothesis, not a forecast backed by existing revenue.

Next.js + Firebase + Gemini, deployed today

- Next.js (App Router) + TypeScript, deployed on Firebase App Hosting
- Firebase Authentication (role chosen per login, not fixed per account)
- Cloud Firestore for the request/quote/message lifecycle
- Cloud Storage for photos and transfer receipts (signed URLs)
- Gemini API (gemini-flash-latest) for triage and receipt review
- Zod contracts end-to-end between client, API routes, and Firestore

WHAT'S NEXT

The gap between today and the 5-year model is the whole job ahead

- The platform mechanics — Gemini triage, matching, private quotes, commission, in-app chat, closing/ratings — are built and live in production.
- What's missing is real demand on both sides of the marketplace: real households, real verified professionals.
- Repo: github.com/Pablolan92/Fiakto — full source available to judges.
- Live staging: fiakto-staging--fiakto.us-central1.hosted.app

Fiakto. Todo tiene solución.
