

Fiakto — P&L summary

Build with Gemini XPRIZE — Profit evidence

Actuals to date (pilot / validation phase)

Fiakto has not launched commercially yet — the requests, quotes, and payments exercised so far were run end to end by the founding team (acting as both customer and professional) to validate the product, not by independent paying customers. Actuals reflect that honestly:

Item	Amount (ARS)	Notes
Revenue (commission collected)	0	No independent, third-party paying customers yet
Transaction volume processed	~\$16,200	One real bank transfer moved through the platform's payment/commission flow during end-to-end validation, between the founders' own test accounts
External funding raised	0	Self-funded

Costs incurred to date

Item	Status	Notes
Firebase App Hosting (Next.js deployment)	Within free/low-usage tier	Single staging backend, low traffic
Firestore + Cloud Storage	Within free/low-usage tier	Validation-scale data volume
Gemini API (gemini-flash-latest)	Within free/low-usage tier	Triage calls during development and testing
Google Cloud TTS/STT	Within free/low-usage tier	Used only to produce the Devpost demo video
Domain / other recurring costs	0	None yet

No material cash costs have been incurred; the project has run inside free or negligible-usage tiers of Google Cloud / Firebase throughout development.

Forward-looking model

The five-year revenue and cost model — completed jobs, average order value, the platform's 8% take rate, professional subscription revenue, COGS, and operating expenses — is an explicit **planning hypothesis**, not a forecast backed by existing revenue: modeled operating profit only turns positive in year 5 (2031), and turns on a thin margin at that volume, so it is sensitive to the assumed take rate and job volume.

What's next

The gap between the actuals above and the five-year model is, honestly, the whole job ahead: getting real households and real professionals transacting on Fiakto. The platform mechanics (Gemini triage, matching, private quotes, commission, in-app chat, closing/ratings) are built and live in production; what's missing is real demand on both sides of the marketplace.
